

Math 142, Calculus I
Spring 2015, 2:10–3:00 MTuWF, Ritter Hall 316

Instructor: Imre Tuba

Office: Ritter Hall 22

Phone: 977-7012

E-mail: tubai@slu.edu

Office hours: 4-5 M, 1-2 Tu, 11-12 W, 3-4 F.

Prerequisites: A grade of C- or higher in Precalculus (Math 141).

Required text: Hughes-Hallett, Gleason, McCallum, et al. Calculus, 6th edition. For this class, the single variable edition is sufficient. We will cover Chapters 1-6.

Course objective: This is a first semester calculus course. We will learn about functions, their rates of change, derivatives, slopes, secant and tangent lines, continuity, differentiability, and a little bit about integration. You will develop a good understanding of these topics to allow you to solve computational problems and to present arguments about how and why these techniques work. Understanding calculus means not only being able to use it to solve computational problems, but also to be able to explain the basic principles why these techniques work and the mathematical connections among them. One objective of the course is for you to be able to give such explanations.

Website: <http://mathcs.slu.edu/~tubai/math142s15>. I will also use Blackboard Learn to post your grades periodically.

Class attendance: This is not distance education. You are expected to attend and participate in every class. If you skip class you will miss the chance to learn skills that will be tested on the exams. You may also miss a quiz and there are no make-ups. Finally, if you keep skipping class, I will think that you are not serious about your education and will remember that when I assign your grade at the end of the semester.

On work outside of class: Have you ever wondered why taking 12 units of classes qualifies you as a full time student? That's only 10 hours per week in class. The reason is that you are expected to do a lot of work on your own outside of class. In fact, the rule of thumb of college education is that for every hour you spend in class, you should expect to spend three hours studying outside of class. That is how 12 units makes full time: 10 hours in class and 30 hours studying outside of class each week. That means you'll need to spend about 7.5 hours a week studying outside of class for this course. That is if you are well-prepared for the course. If your math background is lacking, then you'll have to spend more time. I am not kidding.

Homework and reading will be posted on the class website regularly. You will be able to follow the progress of the course using the website. HW is an essential part of your learning. Take it very seriously. It is extremely important that you keep up with the HW. If you do not, you will quickly find yourself lost in class and at a great disadvantage during exams. Treat the HW as a learning opportunity, rather than something you need to get out of the way. Reread, revise, and polish your solutions until they are correct, concise, efficient, and elegant. This will really deepen your understanding of the material. You won't do well in a math class without doing all of the HW. Attending class and reading your textbook are necessary but not sufficient conditions for passing the course. Expecting to learn math without doing exercises on your own is like expecting to learn to ride a bicycle without ever sitting on a bicycle.

Two kinds of homework will be assigned. Some of your homework will be online, using Webwork, which you can access via a link from the class website. You will get instant feedback. You will typically have several attempts to solve a problem. Use them judiciously. Check your work and try to make sure your solution is correct before submitting it. If you are careless, you will quickly run

out of attempts. The winning strategy is to start working on your homework early, so if Webwork keeps rejecting your solutions, you have time to find the mistakes, and possibly to seek help. Your score on Webwork will be part of your grade in the class.

The other kind of homework will be mostly from the textbook. Your work on these exercises will be tested on quizzes and exams. Every quiz and half of every exam will consist of exercises straight from this kind of homework. After the due date, they can show up on quizzes/exams. I strongly suggest that you write up and turn in your homework by the due date. I will correct your work but will not assign a score to it. This is so you treat the homework as a learning opportunity rather than a means of evaluation. In fact, you can turn in your offline homework to me any time for feedback. I will comment on it and turn it back to you as soon as I can. If you'd like, you can then correct your mistakes and turn it in again for me to check.

There is an obvious winning strategy. Do the HW, seek feedback on it, revise it, and keep your HW notes neat and organized. The familiarity you gain with the exercises by doing this will let you do the quizzes with ease. It will also let you complete half of each exam quickly and move onto the other half of the exam. The experience you gain by keeping up with your homework will be invaluable in doing that other half of the exam. On the other hand, if you do not keep up with your HW, you will face the challenge of solving many unfamiliar problems under time pressure on the quizzes and the exams. This is very difficult and your grade will likely reflect it. Clearly, if you don't turn in homework, I can't give you feedback on your work, no matter how much I want.

Collaboration on the HW: Limited collaboration with your fellow students in the class is OK. But see the section on Academic Integrity! The idea is to let you discuss and critique each other's ideas and not to let you split the workload. Keep collaboration constructive and reasonable. You should fully understand the solution and write it up on your own. Your understanding of the material will be tested on the exams.

If you are approached by another student from the class who wants to copy your HW notes, think twice before generously sharing. You will feel bad if your crafty buddy outscores you on an exam by exploiting your and everybody else's collective wisdom without doing work of his/her own.

Discussion sections: I strongly encourage you to organize a weekly session to work with (not copy from!) your fellow students on problems in class and on the homework. This will help you keep up with your work and get ideas and feedback from others who are grappling with the same exercises as you. You will find that the sense of companionship motivates and encourages you to work.

Quizzes: We will have a quiz about every week and a half. It will be straight from the homework. It is your responsibility to come to class, so if you miss a quiz because you are not there, you will usually not be allowed to make it up. But your lowest quiz score will be dropped. If you miss more than one quiz due to a compelling and documented excuse, let me know.

Exams: There will be two in-class exams, one on Feb 20 and one on Mar 30, as well as a final exam. If you skip an exam, you will normally not be able to make it up, unless you have a compelling (e.g. medical) and documented excuse. Forgetting that there is an exam or being unprepared for it are not considered compelling excuses. Your in-class exam score will be computed as $\frac{2}{3}(\text{higher score}) + \frac{1}{3}(\text{lower score})$.

Final exam: 2-3:50 on Wed, May 6.

Grading scheme:

Online homework	20%
Quizzes	20%
In-class exams	35%
Final exam	25%

A score of 80% or more will guarantee an A- or better, 60% a B- or better, 40% a C- or better, and 20% a D- or better.

On independent work: Problem solving skills are developed by practicing a lot, not by watching other people solve problems. Learning math is much like learning to ride a bicycle in that you learn by doing it and not by watching someone else do it. Attending class and reading the textbook won't be enough to do well on the exams. You should work through every example and argument in the book and in your class notes and expect to have to re-read everything several times. It's slow, but then your reading list for this class is short.

On academic integrity: Using unauthorized aids—including help from another person—on exams and to complete assignments constitutes cheating. Representing someone else's work as your own—even if you make minor changes to it, or reword it—is plagiarism. Cheating and plagiarism are violations of academic integrity and university policy. The consequences are serious, ranging from receiving a failing grade on an assignment in question to expulsion from the university. Don't do it, it's not worth it.

According to SLU's policy on academic integrity, it is your responsibility to report every instance of academic dishonesty that you know of. The same policy applies to me.

Quality of work: It is important that you work neatly on the assignments. The quality of your work will affect your grades on the exams. Quality has to do with how easy it is for someone else to read your solution to a problem. It is not enough to do the math right, you must also communicate it well.

Students with disabilities: If you need special arrangements, let me know well in advance so we can plan to accommodate your needs.
