MCS 115, The Nature of Math Spring 2018, 3:00–4:20 TuTh, OHS 320

Instructor: Imre Tuba

Office: Olin Hall 312 Phone: (507) 933-7009 E-mail: ituba@gustavus.edu

Office hours: 1:30-3 Mon, 12:30-1:30 Tue, 4:30-5:30 Thu, 2:30-3:30 Fri. Tue and Thu office hours are always in my office. On Mon and Fri, I am sometimes on campus and sometimes off campus. When on campus, you can find me in my office during office hours. When off campus, you can talk to me via Skype, Facetime, or Google Hangouts; instructions on how to find me on these services will be posted on Moodle. Each week, I will post on your class website whether I am on campus on Mon and Fri.

Required text: Burger and Starbird: The Heart of Mathematics, 4th Edition. We certainly will not get through the entire book. Each week, I will post on the class website which sections we are covering.

Course objective: This course is an introduction to mathematical thinking and inquiry at the college level. The objective is for you to learn to think, speak, and write about math a little like a working mathematician, obviously without acquiring all of the technical knowledge of a mathematician. We will develop these skills by studying and solving problems in a variety of interesting and useful areas of math. We will challenge your logical, analytical, and critical thinking. An important goal of the course is for you to not only be able to solve such problems but also to thoroughly justify your result, that is to give a detailed explanation of why your result must be correct.

Website: https://homepages.gac.edu/~ituba/mcs115-2s18. I will also use Moodle to post your grades periodically.

Class attendance: This is not distance education. You are expected to attend and participate in every class. If you skip class you will miss the chance to learn skills that will be tested on the exams. You may also miss a quiz. Finally, if you keep skipping class, I will think that you are not serious about your education and will remember that when I assign your grade at the end of the semester.

On work outside class: Have you ever wondered why taking four classes per semester is a full course load at Gustavus? That's only about 11-14 hours per week in class. The reason is that you are expected to do a lot of work on your own <u>outside class</u>. In fact, the rule of thumb of college education is that for every hour you spend in class, you should expect to spend two-three hours studying outside class. That is how four classes make a full course load. That means you should expect to spend about 8-12 hours a week studying outside the classroom for this course. If you are well-prepared for the course, you will spend less. If your math background is lacking, then you'll have to spend more time.

Homework and reading will be posted on the class website regularly. You will be able to follow the progress of the course using the website. HW is an essential part of your learning. Take it very seriously. It is extremely important that you keep up with the HW. If you do not, you will quickly find yourself lost in class and at a great disadvantage during exams. Treat the HW as a learning opportunity, rather than something you need to get out of the way. Reread, revise, and polish your solutions until they are correct, concise, efficient, and elegant. This will really deepen your understanding of the material. You won't do well in a math class without doing all of the HW. Attending class and reading your textbook are necessary but not sufficient conditions for passing the course. Expecting to learn math without doing exercises on your own is like expecting to learn to ride a bicycle without ever sitting on a bicycle.

Two kinds of homework will be assigned. Some of your homework will be online, using Webwork, which you can access via a link from the class website. You will get instant feedback. You will typically have several attempts to solve a problem. Use them judiciously. Check your work and try to make sure your solution is correct before submitting it. If you are careless, you will quickly run out of attempts. The winning strategy is to start working on your homework early, so if Webwork keeps rejecting your solutions, you have time to find the mistakes, and possibly to seek help. Your score on Webwork will be part of your grade in the class.

The other kind of homework will be from the textbook. Your work on these exercises will be tested on quizzes and exams. Every quiz and half of every exam will consist of exercises straight from this kind of homework. After the due date, they can show up on quizzes/exams. I strongly suggest that you write up and turn in your homework by the due date. We will correct your work but will not assign a score to it. This is so you treat the homework as a learning opportunity rather than a means of evaluation. In fact, you can turn in your offline homework any time for feedback. We will turn it back to you as soon as we can. If you'd like, you can then correct your mistakes and turn your HW in again for us to check.

There is an obvious winning strategy. Do the HW, seek feedback on it, revise it, and keep your HW notes neat and organized. The familiarity you gain with the exercises by doing this will let you do the quizzes with ease. It will also let you complete half of each exam quickly and move onto the other half of the exam. The experience you gain by keeping up with your homework will be invaluable in doing that other half of the exam. On the other hand, if you do not keep up with your HW, you will face unfamiliar problems under time pressure on quizzes and exams. This is very difficult and your grade will likely reflect it. Clearly, <u>if you don't turn in homework</u>, we can't give you feedback on your work, no matter how much we want.

Collaboration on the HW: Limited collaboration with your fellow students in the class is OK. But see the section on Academic Integrity! The idea is to let you discuss and critique each other's ideas and not to let you split the workload. Keep collaboration constructive and reasonable. You should fully understand the solution and write it up on your own. Your understanding of the material will be tested on the exams.

If you are approached by another student from the class who wants to copy your HW notes, think twice before generously sharing. You will feel bad if your crafty buddy outscores you on an exam by exploiting your and everybody else's collective wisdom without doing work of his/her own.

Discussion sections: I strongly encourage you to organize a weekly session to work with (not copy from!) your fellow students on problems in class and on the homework. This will help you keep up with your work and get ideas and feedback from others who are grappling with the same exercises as you. You may find that the sense of companionship motivates you to work.

Quizzes: We will have a quiz on average every one and a half to two weeks. The quizzes will not be announced in advance, and "on average" means they will generally not be given at regular intervals. The quiz will be straight from the homework. It is your responsibility to come to class, so if you miss a quiz because you are not there, you will usually not be allowed to make it up. But your lowest quiz score will be dropped. If you miss more than one quiz due to a <u>compelling and documented</u> excuse, let me know.

Project: You will be asked to team up with a few fellow students to select a topic that you and your group delve into in greater depths and present to your classmates. I will post suggested topics when the time comes, but if you have a topic close to your heart that you would like to study, I am open to the possibility. It will be your opportunity to show off how you can think, speak, and

write like a mathematician.

Exams: There will be two in-class exams on Mar 20 and Apr 26, as well as a final exam. If you skip an exam, you will normally not be able to make it up, unless you have a compelling (e.g. medical) and documented excuse. Forgetting that there is an exam or being unprepared for it are not considered compelling excuses. Your in-class exam score will be computed as 2/3(higher score)+1/3(lower score).

Final exam: 3:30-5:30 on Sat, 5/26 in NHS 201.

Quality of work: It is important that you work neatly on the assignments. The quality of your work will affect your grades on the exams. Quality has to do with how easy it is for someone else to read your solution to a problem. It is not enough to do the math right, you must also communicate it well.

Grading scheme:

Online homework	20%
Quizzes	20%
Project presentation	10%
In-class exams	25%
Final exam	25%

A score of 80% or more will guarantee an A- or better, 60% a B- or better, 40% a C- or better, and 20% a D- or better.

On independent work: Problem solving skills are developed by practicing a lot, not by watching other people solve problems. Learning math is much like learning to ride a bicycle in that you learn by doing it and not by watching someone else do it. Attending class and reading the textbook won't be enough to do well on the exams. You should work through every example and argument in the book and in your class notes and expect to have to re-read everything several times. It's slow, but then your reading list for this class is short.

On academic integrity: Using unauthorized aids-including help from another person-on exams and to complete assignments constitutes cheating. Representing someone else's work as your own-even if you make minor changes to it, or reword it-is plagiarism. Cheating and plagiarism are violations of academic integrity and university policy. The consequences are serious, ranging from receiving a failing grade on an assignment in question to expulsion from the College. Don't do it, it's not worth it. If you are in doubt whether what you are doing is legitimate, it is better to ask me.

According to the College's Academic Honesty Policy and the Honor Code (https://gustavus.edu/general_catalog/current/acainfo, it is your responsibility not only to not commit any act of academic dishonesty yourself, but also to report every instance of academic dishoquesty that you know of.

Students requiring special accomodations: Gustavus Adolphus College is committed to ensuring the full participation of all students in its programs. If you have a documented disability, or you think you may have a disability of any nature (e.g., mental health, attentional, learning, chronic health, sensory, or physical) and, as a result, need reasonable academic accommodation to participate in class, take tests or benefit from the College's services, then you should speak with the Accessibility Resources staff, for a confidential discussion of your needs and appropriate plans. Course requirements cannot be waived, but reasonable accommodations may be provided based on disability documentation and course outcomes. Accommodations cannot be made retroactively; therefore, to maximize your academic success at Gustavus, please contact Accessibility Resources as early as possible. Accessibility Resources (https://gustavus.edu/advising/disability) is located in the Center for Academic Resources and Enhancement. Accessibility Resources Coordinator, Kelly Karstad, (kkarstad@gustavus.edu or x7138), can provide further information. If you need special arrangements, let me know well in advance so we can plan to accommodate your needs.
